1: Overall shield drain wire connected to #8 splice lug for termination at chassis. Leave enough wire length to reach chassis mounting post.

2: At twisted pair drain wires connected together, insulated from overall shield, and attached to pin A. Use electrical tape to electrically isolate individual drain terminations from overall shield.

3: Terminate drain wires of unused pairs with other twisted pair drain wires to facilitate using these for repairs.

4: Cover unused pair wire ends with heatshrink tubing.

5: Pair arrangement chosen to simplify cable wiring.
